

ABSTRACT OF THE DISCLOSURE

Objects of this invention

Reliability and productivity of electrical connection is
5 enhanced by means of preventing centering error of the
electrical contact of the terminal.

How to be solved

00973463-101101
10 An electrical connector comprises a terminal 15, which is
provided at one end thereof with an electrical contact portion
16 for connecting with a mating terminal and at the other end
with an electric wire joint portion 18 for an electric wire 40,
and a connector housing 1 which is provided with a terminal
receiving section 6 and receives the terminal 15, wherein the
15 terminal receiving section 6 provides an extra room for the
electrical contact portion 16, wherein the electrical contact
portion 16 and the electric wire joint portion 18 are connected
with a flexible connecting part 20. The connecting part 20 is
formed into sheet shape extending from a bottom base plate 26
of the electrical contact portion 16. The connecting part 20
20 is provided at both sides with a couple of cutouts 21. The
connecting part 20 has narrower width than that of the bottom
base plate 26 of the electrical contact portion 16 and that of
the bottom base plate 27 of the electric wire joint portion 18.
